

# Advanced Systems Lab

Spring 2025

*Lecture:* Memory bound computation, sparse linear algebra, OSKI

**Instructor:** Markus Püschel

**TA:** Tommaso Pegolotti, several more

Eidgenössische Technische Hochschule Zürich  
Swiss Federal Institute of Technology Zurich

1

## Overview

Memory bound computations

Sparse linear algebra, OSKI

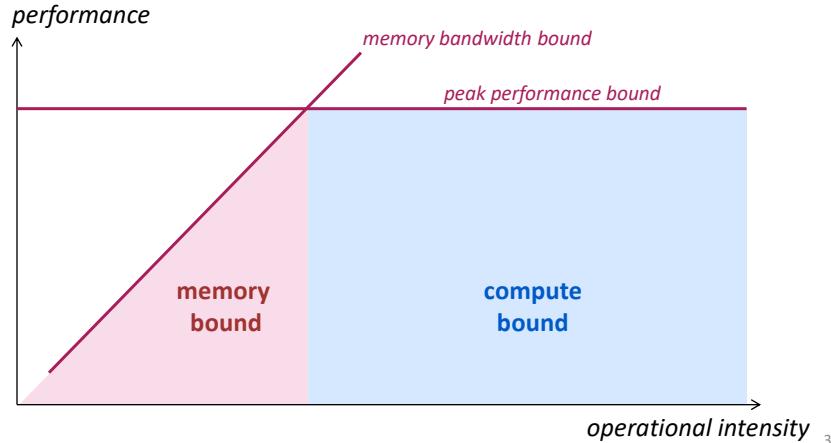

2

2

# Memory Bound Computation

Data movement, not computation, is the bottleneck

Typically: Computations with operational intensity  $I(n) = O(1)$

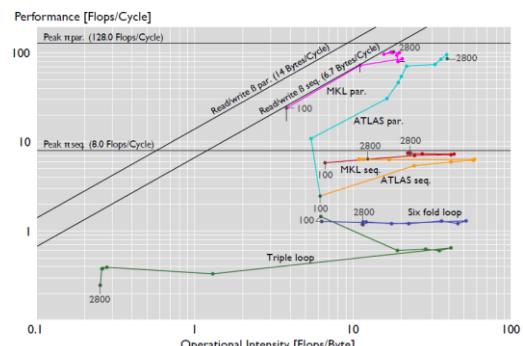

3

# Memory Bound Or Not? Depends On ...

## The computer

- *Memory bandwidth*
- *Cache size*
- *Peak performance*

## The algorithm

- *Dependencies*

## How it is implemented

- *Good/bad locality*
- *SIMD or not*

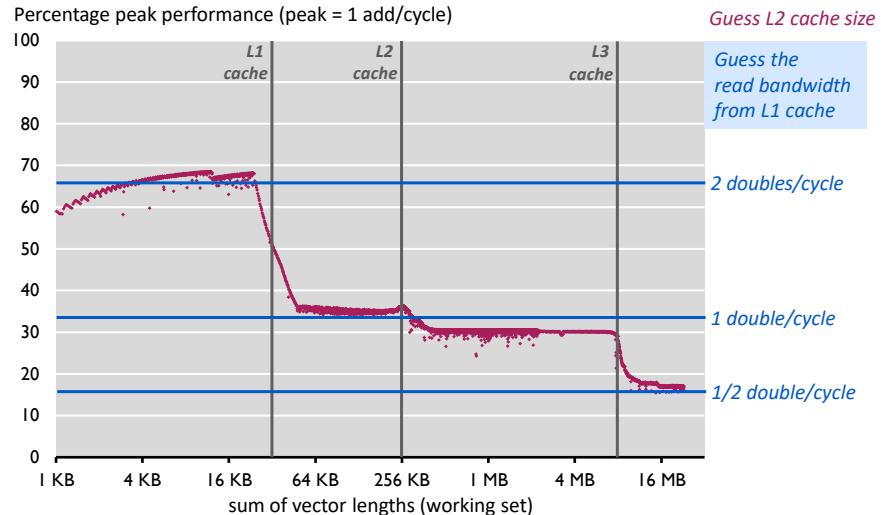

## How the measurement is done

- *Cold or warm cache*
- *In which cache data resides*
- *See next slide*

4

## Example: BLAS 1, Warm Data & Code

$z = x + y$  on Core i7 (Nehalem, one core, no SSE), `icc 12.0 /O2 /fp:fast /Qipo`

5

## Sparse Linear Algebra

Sparse matrix-vector multiplication (MVM)

Sparsity/Bebop/OSKI

6

# Sparse Linear Algebra

Very different characteristics from dense linear algebra (LAPACK etc.)

Applications:

- finite element methods
- PDE solving
- physical/chemical simulation  
(e.g., fluid dynamics)
- linear programming
- scheduling
- signal processing (e.g., filters)
- ...

*Core building block: Sparse MVM*

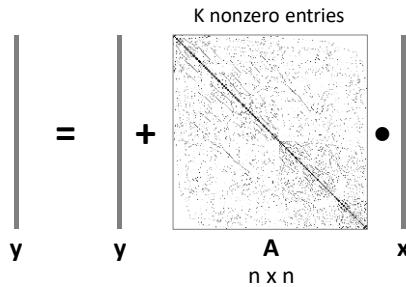

Graphics: [http://aam.mathematik.uni-freiburg.de/IAM/homepages/claus/projects/unfitted-meshes\\_en.html](http://aam.mathematik.uni-freiburg.de/IAM/homepages/claus/projects/unfitted-meshes_en.html)

7

7

## Sparse MVM (SMVM)

$y = y + Ax$ , A sparse but known (below A is square)

Typically executed many times for fixed A

What is reused (possible temporal locality)?

Upper bound on operational intensity?  $I(n) \leq \frac{2K}{8(K+3n)} \leq \frac{1}{4}$

8

8

# Storage of Sparse Matrices

Standard storage is obviously inefficient: Many zeros are stored

- *Unnecessary operations*
- *Unnecessary data movement*
- *Bad operational intensity*

Several sparse storage formats are available

Popular for performance: Compressed sparse row (CSR) format

9

9

# CSR

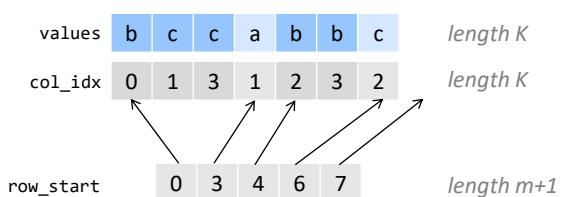

Assumptions:

- $A$  is  $m \times n$
- $K$  nonzero entries

$A$  as matrix

b	c		c
	a		
		b	b
			c

$A$  in CSR:

Storage:

- $K$  doubles +  $(K+m+1)$  ints =  $\Theta(\max(K, m))$
- Typically:  $\Theta(K)$

10

10

## Sparse MVM Using CSR

$$y = y + Ax$$

```
void smvm(int m, const double* values, const int* col_idx,
          const int* row_start, double* x, double* y)
{
    int i, j;
    double d;

    /* loop over m rows */
    for (i = 0; i < m; i++) {
        d = y[i]; /* scalar replacement since reused */

        /* loop over non-zero elements in row i */
        for (j = row_start[i]; j < row_start[i+1]; j++)
            d += values[j] * x[col_idx[j]];
        y[i] = d;
    }
}
```

CSR + sparse MVM: Advantages?

11

11

## CSR

Advantages:

- *Only nonzero values are stored*
- *All three arrays for A (values, col\_idx, row\_start) accessed consecutively in MVM (good spatial locality)*
- *Good temporal locality with respect to y*

Disadvantages:

- *Insertion into A is costly*
- *Poor temporal locality with respect to x*

12

12

# Impact of Matrix Sparsity on Performance

Addressing overhead (dense MVM vs. dense MVM in CSR):

- ~ 2x slower (*example only*)

Fundamental difference between MVM and sparse MVM (SMVM):

- *Sparse MVM is input **dependent** (sparsity pattern of A)*
- *Changing the order of computation (e.g., when blocking) requires changing the data structure (CSR)*

13

13

# Bebop/Sparsity: SMVM Optimizations

*Idea:* Blocking for registers

*Reason:* Reuse  $x$  to reduce memory traffic

*Execution:* Block SMVM  $y = y + Ax$  into micro MVMs

- *Block size  $r \times c$  becomes a parameter*
- *Consequence: Change A from CSR to  $r \times c$  block-CSR (BCSR)*

BCSR: Next slide

14

14

## BCSR (Blocks of Size $r \times c$ )

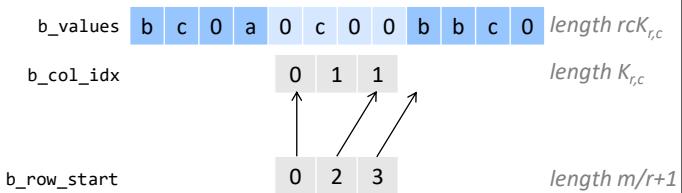

Assumptions:

- $A$  is  $m \times n$
- Block size  $r \times c$
- $K_{r,c}$  nonzero blocks

$A$  as matrix ( $r = c = 2$ )

b	c		c
	a		
		b	b
	c		

$A$  in BCSR ( $r = c = 2$ ):

Storage:

- $rcK_{r,c}$  doubles +  $(K_{r,c}+m/r+1)$  ints =  $\Theta(rcK_{r,c})$  (in typical case  $K \geq m$ )
- $rcK_{r,c} \geq K$

15

15

## Sparse MVM Using $2 \times 2$ BCSR

```
void smvm_2x2(int bm, const int *b_row_start, const int *b_col_idx,
               const double *b_values, double *x, double *y)
{
    int i, j;
    double d0, d1, c0, c1;

    /* loop over bm block rows */
    for (i = 0; i < bm; i++) {
        d0 = y[2*i]; /* scalar replacement since reused */
        d1 = y[2*i+1];

        /* dense micro MVM */
        for (j = b_row_start[i]; j < b_row_start[i+1]; j++, b_values += 2*2) {
            c0 = x[2*b_col_idx[j]+0]; /* scalar replacement since reused */
            c1 = x[2*b_col_idx[j]+1];
            d0 += b_values[0] * c0;
            d1 += b_values[2] * c0;
            d0 += b_values[1] * c1;
            d1 += b_values[3] * c1;
        }
        y[2*i] = d0;
        y[2*i+1] = d1;
    }
}
```

16

16

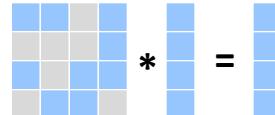

## BCSR

Advantages:

- *Temporal locality with respect to x and y*
- *Reduced storage for indexes*

Disadvantages:

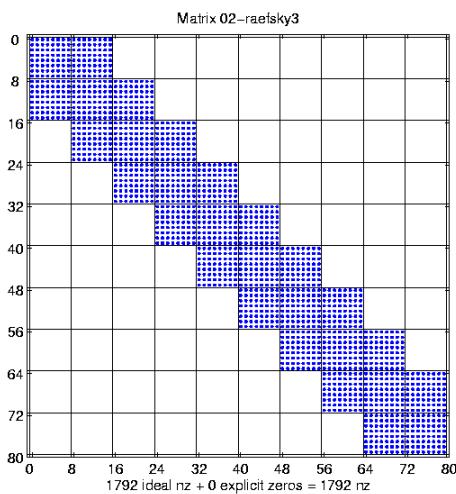

- *Storage for values of A increased (zeros added)*
- *Computational overhead (also due to zeros)*

17

17

## Which Block Size ( $r \times c$ ) is Optimal?

*Example:*

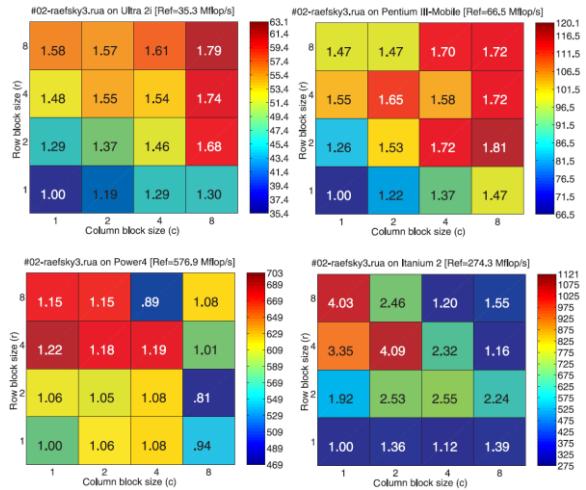

- 20,000 x 20,000 matrix (only part shown)
- Perfect 8 x 8 block structure
- No overhead when blocked  $r \times c$ , with  $r, c$  divides 8

source: R. Vuduc, Georgia Tech

18

18

## Speed-up Through $r \times c$ Blocking

- machine dependent
- hard to predict

Source: Eun-Jin Im, Katherine A. Yelick, Richard Vuduc. SPARSITY: An Optimization Framework for Sparse Matrix Kernels, Int'l Journal of High Performance Comp. App., 18(1), pp. 135-158, 2004

19

## How to Find the Best Blocking for given A?

Best block size is hard to predict (see previous slide)

*Solution 1:* Searching over all  $r \times c$  within a range, e.g.,  $1 \leq r, c \leq 12$

- Conversion of A in CSR to BCSR roughly as expensive as 10 SMVMs
- So total cost = 1440 SMVMs
- Too expensive

*Solution 2:* Model

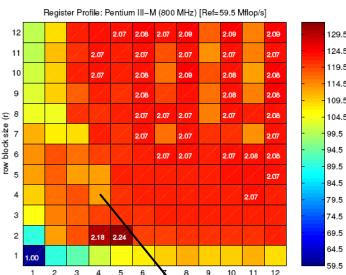

- Estimate the gain through blocking
- Estimate the loss through blocking
- Pick best ratio

20

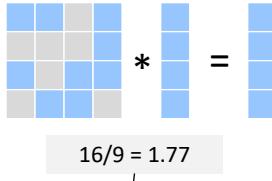

20

## Model: Example

Gain by blocking (dense MVM)

Overhead (average) by blocking

1.4

1.4/1.77 = 0.79 (no gain)

*Model:* Doing that for all r and c and picking best

21

21

## Model

*Goal:* find best  $r \times c$  for  $y = y + Ax$

*Gain* through  $r \times c$  blocking (estimation):

$$G_{r,c} = \frac{\text{dense MVM performance in } r \times c \text{ BCSR}}{\text{dense MVM performance in CSR}}$$

dependent on machine, independent of sparse matrix

*Overhead* through  $r \times c$  blocking (estimation)

scan part of matrix A

$$O_{r,c} = \frac{\text{number of matrix values in } r \times c \text{ BCSR}}{\text{number of matrix values in CSR}}$$

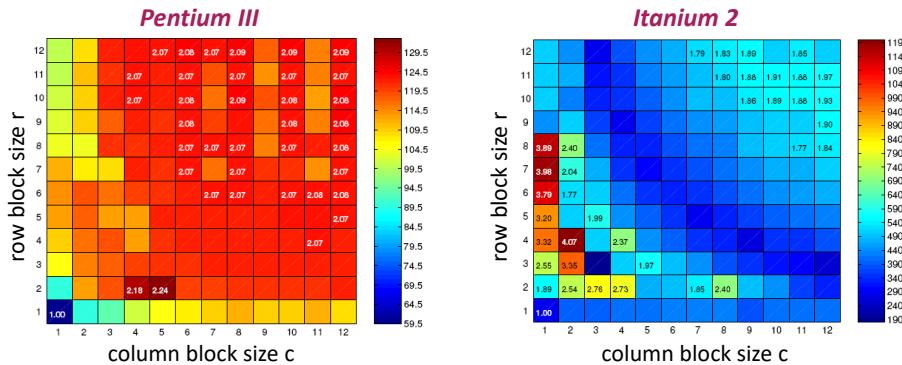

independent of machine, dependent on sparse matrix

*Expected gain:*  $G_{r,c}/O_{r,c}$

22

22

## Gain from Blocking (Dense Matrix in BCSR)

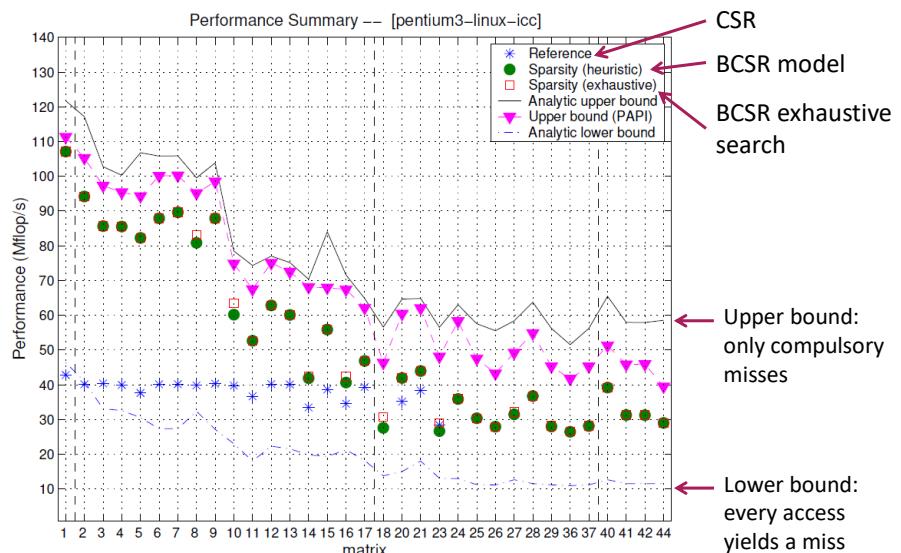

- machine dependent
- hard to predict

Source: Eun-Jin Im, Katherine A. Yelick, Richard Vuduc. SPARSITY: An Optimization Framework for Sparse Matrix Kernels, Int'l Journal of High Performance Comp. App., 18(1), pp. 135-158, 2004

23

## Typical Result (assumes cold cache)

Source: Eun-Jin Im, Katherine A. Yelick, Richard Vuduc. SPARSITY: An Optimization Framework for Sparse Matrix Kernels, Int'l Journal of High Performance Comp. App., 18(1), pp. 135-158, 2004

24

24

# Principles in Bebop/Sparsity Optimization

Optimization for memory hierarchy = increasing locality

- *Blocking for registers (micro-MVMs)*
- *Requires change of data structure for A*
- *Optimizations are input dependent (on sparse structure of A)*

Fast basic blocks for small sizes (micro-MVM):

- *Unrolling + scalar replacement*

Search for the fastest over a relevant set of algorithm/implementation alternatives (parameters r, c)

- *Use of performance model (versus measuring runtime) to evaluate expected gain*

**Different from ATLAS**

25

25

# SMVM: Other Ideas

Value compression

Index compression

Pattern-based compression

Multiple inputs

26

26

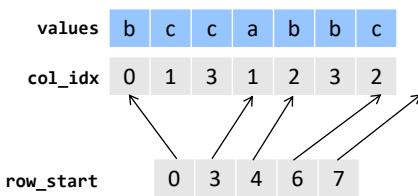

# Value Compression

*Situation:* Matrix A contains many duplicate values

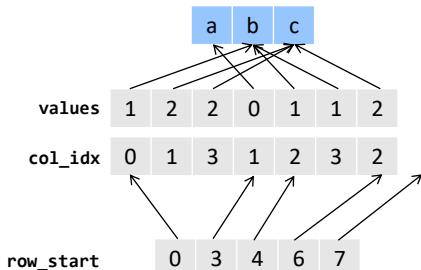

*Idea:* Store only unique ones plus index information

b	c		c
	a		
		b	b
	c		

A in CSR:

A in CSR-VI:

Kourtis, Goumas, and Koziris, Improving the Performance of Multithreaded Sparse Matrix-Vector Multiplication using Index and Value Compression, pp. 511-519, ICPP 2008

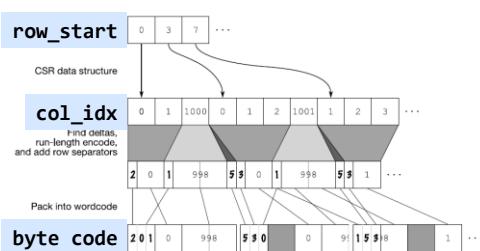

27

# Index Compression

*Situation:* Matrix A contains sequences of nonzero entries

*Idea:* Use special byte code to jointly compress col\_idx and row\_start

Coding

Decoding

```

0: acc = acc * 256 + arg;
1: col = col + acc * 256 + arg; acc = 0;
   emit_element(row, col); col = col + 1;
2: col = col + acc * 256 + arg; acc = 0;
   emit_element(row, col);
   emit_element(row, col + 1); col = col + 2;
3: col = col + acc * 256 + arg; acc = 0;
   emit_element(row, col);
   emit_element(row, col + 1);
   emit_element(row, col + 2); col = col + 3;
4: col = col + acc * 256 + arg; acc = 0;
   emit_element(row, col);
   emit_element(row, col + 1);
   emit_element(row, col + 2);
   emit_element(row, col + 3); col = col + 4;
5: row = row + 1; col = 0;

```

28

28

## Pattern-Based Compression

*Situation:* After blocking A, many blocks have the same nonzero pattern

*Idea:* Use special BCSR format to avoid storing zeros;  
needs specialized micro-MVM kernel for each pattern

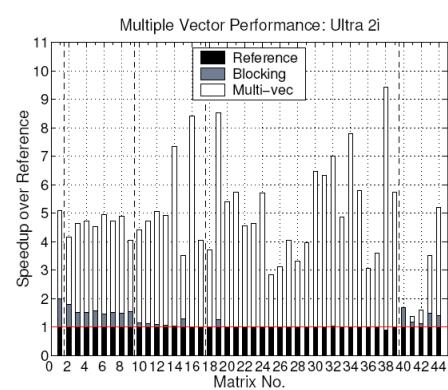

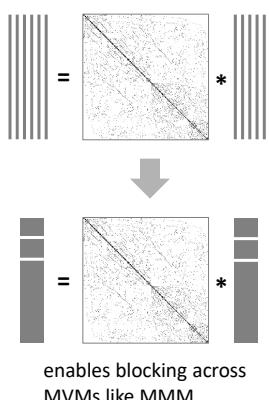

Source: Belgin, Back, and Ribbens, Pattern-based Sparse Matrix Representation  
for Memory-Efficient SMVM Kernels, pp. 100-109, ICS 2009

29

## Multiple Inputs

Situation: Compute SMVM  $y = y + Ax$  for several independent  $x$

Experiments: up to 9x speedup for 9 vectors

Source: Eun-Jin Im, Katherine A. Yelick, Richard Vuduc. SPARSITY: An Optimization Framework for Sparse Matrix Kernels, Int'l Journal of High Performance Comp. App., 18(1), pp. 135-158, 2004
